

Diabetes Foot Care

Diabetes Can Mean Double Trouble For Your Feet!

First, diabetes can reduce blood flow to your feet, depriving your feet of oxygen and nutrients. This makes it more difficult for blisters, sores, and cuts to heal.

Second, the diabetic nerve damage called peripheral neuropathy can cause numbness in your feet. When you can't feel cuts and blisters, you're more likely to get sores and infections.

Check both feet daily.

Look over both feet carefully every day, and be sure you check between all of your toes. Blisters and infections can start between your toes, and with diabetic neuropathy, you may not feel them until they've become irritated or infected. If a physical challenge keeps you from checking your own feet, ask a family member to help.

Wash with warm -- not hot -- water.

Wash both of your feet briefly each day with warm -- not hot -- water. You may not be able to feel heat with your feet, so test the water with your hands first. Avoid soaking too long in water, since waterlogged sores have a harder time healing. Dry your feet right away, and remember to dry gently between all of your toes.

Make sure your shoes fit well.

It's an investment worth making. Even the slightest rubbing or misfit shoe can cause a blister that turns into a sore that becomes infected and never heals. Buy better-fitting shoes, or try different socks, even at the most minor signs of redness or irritation, since you may not be able to feel when it's getting worse. Before buying or putting on the shoes check your shoes for rough seams, sharp edges or other objects that could hurt your feet. And break your shoes in gradually.

Skip the barefoot look.

Always wear shoes or slippers. Always wear socks with your shoes, since leather, plastics, and manmade shoe materials can irritate your skin and quickly bring on blisters. While you might prefer the look of hose, nylon knee-highs, or thin socks, you may find that these don't give your toes or heels enough protection. Wear thicker socks to pad your feet and cushion any calluses or sore spots.

Diabetes Foot Care

Speak up.

Nerve damage can be unpredictable. Tell your doctor about any changes in sensation in your toes, feet, or legs. Speak up if you notice pain, tingling, a pins-and-needles feeling, numbness, or any other unusual signs.

Stay soft, but dry.

Your skin may be dry and cracked because of high glucose levels, and cracked skin means it's easier for bacteria to get under your skin and harder for infections to heal. Use a small amount of skin lotion daily, but be sure your feet feel dry, not damp or sticky, afterward. Try not to get the lotion in between your toes. Keep toenails trimmed and filed smooth to avoid ingrown toenails.

Try non-impact exercise.

Swimming, cycling, yoga, and tai chi are increasingly popular ways to exercise -- with minimal impact on your feet. Talk with your doctor before starting an exercise program.

Fix bunions, corns, and hammertoes.

If your big toe slants sharply in toward your other toes, with a big bump on the knuckle of your big toe, you've got a classic bunion. Corns are spots of thick, rough skin, where the tissue builds up on toes constantly barraged by too much rubbing or pressure. A buckled-under toe, called a hammertoe, can result from muscle weakness caused by diabetic nerve damage. Regular podiatry visits are highly recommended.

Consider fitted orthotics.

A podiatrist can also fit you with shoe inserts called orthotics to support your feet if your have diabetic nerve pain or the muscles have become weak from nerve damage. If pain or weakness is so severe that it's too painful or even impossible to walk, a foot brace or orthopedic shoes might help. A podiatrist is your best source for these devices.

Identify & Report Pain to Extremities.

The best prevention for nerve pain, ultimately, is to manage your diabetes well. Controlling your blood glucose also helps reduce the symptoms of diabetic nerve pain identified as numbness, tingling, burning, to extremities. So the good news is that controlling your glucose levels with diet, exercise, and if needed, medications can not only help prevent diabetic peripheral neuropathy, but they can also help ease its effects.

Diabetes Foot Care

Protect Your Feet.

Your feet are your source of independence, or at least its foundation. Give your feet a little tenderness, a little loving care, each day. And be sure to have your doctor take a good look at your feet during each of your diabetes checkups in case you've missed anything.

Take Responsibility to Manage your Illness.

By developing a routine for regular monitoring and adhering to your prescribed medical regime, complications related to Diabetes can be managed through diet, exercise, medication and preventative care.
